

## DRaaS utilising Microsoft ASR

### Why DraaS?

Disaster Recovery (DR) has long been a bone of contention. DR is the ultimate insurance policy for your systems and data. Whether or not to invest in DR and how to approach your strategy is a frequent topic of debate for senior management and the board.

Add to this regulatory compliance and business insurance requirements and DR has become a costly and time consuming challenge.

DRaaS from think S3 and Microsoft means that IT no longer has to create an entire replicated DR site, and can move away from today's complexity and premium costs. Being Hypervisor agnostic and including physical servers means that the service is incredibly flexible too.

### DraaS from think S3

Our service ensures complete confidence and clockwork like efficiency when you need it most.

Combining Microsoft ASR with think S3's 20+ years' experience in designing and implementing enterprise class DR platforms, DRaaS delivers strategy confidence, flexibility and cost effectiveness to your DR plan.

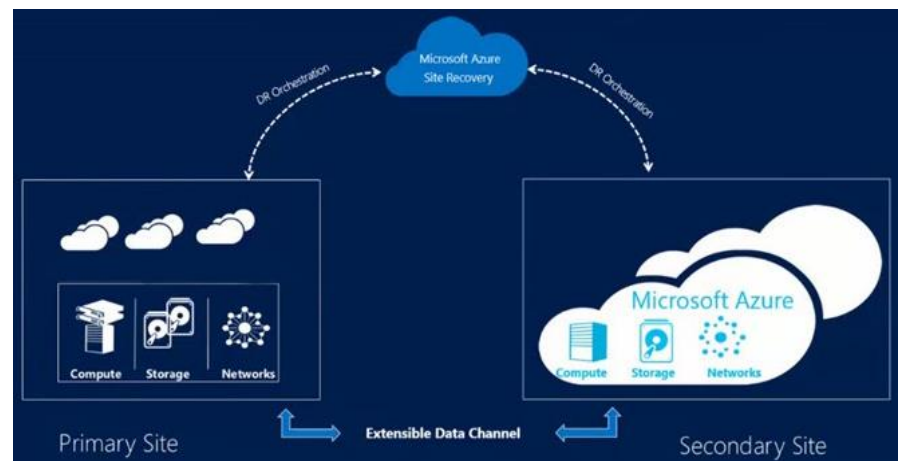

From service design and planning to ongoing management, support and training your team, DraaS from think S3 leaves no stone unturned.

### Available Service Features

- ✓ Workload Assessment
